

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

Beam Modeling for a Novel Convergent X-ray Treatment Machine

Joint AAPM/COMP Meeting
July 12 2020

Dragan Mirkovic, Dirk A. Bartkoski, Ramesh Tailor, Jamshid Moradi Kurdestany, Mohammad Salehpour
The University of Texas MD Anderson Cancer Center, Houston TX

30 – 80 individual tiles per ring

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

Convergent x-ray beam radiotherapy

CRnR technology utilizes:

- Monochromatic low-energy x-ray beam (e.g. 60 KeV)
- Narrow convergent beam
- Concentrated dose build up at the tumor area
- A simple and inexpensive system
- A sharp dose fall-off outside the tumor that enables accurate treatment
- Unmatched accuracy of treatment for shallow lesions (<10 cm)
- Very small size of the focal spot (0.5 – 3 mm)
- Position of the focal spot is fixed and determined by the geometry of the lens (no range uncertainty)
- Treatment planning similar to IMPT (it is easy to produce highly conformal treatments)
- Significantly smaller shielding requirements
- Highly maneuverable device (mounted on a robotic arm)

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

The Principle of X-ray lens (Elastic Coherent Scattering)

First theory proposed by father and son Bragg in 1913

$$2d\sin\theta = n\lambda$$

The interplanar distance d determines the angle of constructive interference

$$d^2 = a^2/(h^2 + k^2 + l^2)$$

In 3D cubic crystal lattice with lattice constant a there are many possible planes indexed by Miller indices h, k, l

Aluminum has face centered cubic lattice ($1, 1, 1$ plane shown)

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

CRnR X-Ray Lens

Crystal properties

- High integrated reflectivity
- Integral of the reflectivity over the angular and energy acceptance of the crystal
- Mosaic structure or curved diffracting planes (CDPs) are the best choice
- Single-Crystal Aluminum ($a = 4.05 \text{ \AA}$)

X-ray energy

- Mainly the of K- α_1 of tungsten, 59.3 keV
- Some of the of the K- α_2 , 58.0 keV

In-water dose measurements – experimental setup

Three self-leveling lasers used for focal spot alignment highlighted by red arrows.

CRnR experimental setup including x-ray tube, focusing lens, and support cage.

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

In-Water Measurement Analysis

Isodose curves for focused 60 kV x-rays.

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

In-Water Measurement

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

Treatment planning for convergent x-rays

Convergent beam treatment planning requires the following steps:

- Photon source model
- Dose computation algorithm(s)
 - Monte Carlo
 - Pencil beam or convolution/superposition
- Patient model
 - Physical and biological models
- Constrained optimization algorithm

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

Beam model

The photon source is specified as a 5D flat surface phase space file

- $\Phi(x, y, E, \Omega)$
- z coordinate is constant

The model can be used directly in MC computations and as a energy fluence for treatment planning dose calculations

First step: Energy dependence

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

Energy spectrum measurement

Measurements using Amptek CdTe spectrometer

Measure tube spectrum using beam scattered at 90°

Use Pb-XRF for calibration of the spectrometer

- Thin sheet of lead on top of the graphite block

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

Calibration measurement

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

Spectral lines selected for calibration

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

Calibration fit

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

90° Compton correction

X-rays scattered at 90° have reduced energy if scattering is incoherent

$$h' = \frac{h}{1 + \frac{h}{511}} \text{ (keV)}$$

For $E < 150$ keV coherent scattering is dominant in lead and incoherent (Compton) scattering is dominant in Carbon

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

CdTe Detection Efficiency

CdTe detector consists of 1 mm CdTe crystal behind 0.1mm Be window

Window dominates low energy response

1 mm CdTe thickness defines high energy response

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

Measured x-ray tube spectrum

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

Focal spot spectrum

Direct measurement at the focal spot

Spectrometer positioned using laser alignment

K α_1 peak = 59.3 keV

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

Measured beam fluence

Beam Model

Assume axial symmetry:

$$\Phi(r, \theta, E, \Omega) = X(r, \theta) \Psi(r, \theta, E, \Omega)$$

$$= R(r) \Theta(r, \theta) \Psi(r, \theta, E, \Omega)$$

Step 1: Find radial component $R(r)$ using multi-Gaussian fit

$$R(r) = \sum_{j=1}^5 g_j [A_j, c_j, \sigma_j](r)$$

Quality of the fit: $R^2 = 0.998$

Results:

- 3 narrow peaks with $\sigma \approx 1.1$ mm
- Wide peak in the center
- $\sigma \approx 13.5$ mm

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

Radial component

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

Directional component

Use 1st three images to get the initial estimate of the directional component $\Psi(r, \theta, E, \Omega)$

The remaining images used for verification and refinement

Tree curves converge for $z = 81$ cm.

Compute a fit for $\mu = \cos\theta$ as a function of r and z

Miller indices vs. θ

- (111): 2.5623 (expected)
- (220): 4.1865 (expected)
- (420): 6.6283 (expected)

MD Anderson | Treatment planning for Convergent X-ray Beam Radiation Therapy

Photon Spread Out Peak (PSOP)

PSOP designed from 3 focal spots ranging from 2 to 5 cm in depth in water.

PSOP designed from 5 focal spots ranging from 4 to 8 cm in depth in water.
